

# Debugging embedded targets with Eclipse

Either you know how to do it and you can handle it on your own, or you shouldn't touch this at all. In the latter case, use the command-line GDB client instead. It requires some getting used to, but in the end it pays off because unlike Eclipse it is marvelously reliable, simple, and predictable.

You may also find this highly relevant: [Dronocode Probe documentation](#).

Users of the command-line GDB client will likely greatly benefit from the [GDB Dashboard](#) project by [Andrea Cardaci](#).
